

Agreement Regarding the Use of 700 MHz State Allotment in DHS Region-1

DHS Region-1 and FCC Region-19 consist of the states of Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island and Vermont.

The following is based upon the unanimous agreement of representatives from the states of Connecticut, Massachusetts and Rhode Island, along with the US DHS Office of Emergency Communication (OEC) Region-1 Coordinator, who attended a coordination meeting to discuss issues related to the use of shared channels in the state allocations within the 700 MHz public safety band:

1. For the purposes of determining where specific frequencies can be used, and to avoid interference issues, states will use the CAPRAD (Computer Assisted Pre-Coordination Resource And Database) sort as the starting point.
2. In preparing applications, states must adhere to all FCC regulations consistent with the standards outlined in the current FCC Region-19 plan. The applying state will submit these plans to the other states within FCC Region-19 for review and approval. This will assure coordinated efforts and avoid interference issues.
3. CAPRAD sort frequency allocations (which are by county) may be used in that county after notification to the FCC Region-19 Committee. FCC Region-19 will notify the adjacent FCC Regions 8 and 30 of the particular frequencies that are being used. This is not an approval procedure – as long as the CAPRAD sort is being followed, approval from adjacent FCC regions is not required.
4. If any State wishes to utilize state-allocated frequencies outside of the CAPRAD sort, that use will require pre-coordination through the Statewide Interoperability Coordinators (SWIC's).
 - a. The requesting state will provide the SWIC's with coordination engineering data, following the FCC Region-19 700 MHz plan requirements.
 - b. FCC Region-19 will provide the notification to FCC Region-8 and FCC Region-30 regarding the frequencies selected.
 - c. The DHS Region-1 SWICs will require that approval must be received prior to implementation of the non-CAPRAD sort state frequencies.
